

STRATA

X-RAY FOR LEGACY SYSTEMS

An AI agent that turns weeks of legacy-code archaeology into an afternoon —
with a human approving every step.

BOUNTY · Conduct Track — Make Legacy Move

BOUNTY · Fetch.ai — Agentverse / ASI:One

UK AI Agent Hackathon EP5 × Conduct · Imperial College London · July 2026

live: strata.axiqo.xyz · github.com/a252937166/strata · video: youtu.be/14bQdHeTWjs

The problem

the slow enterprise process we picked

Millions of lines, decades deep

Enterprises run on custom code written by people who have left. Documentation is thin; the few remaining specialists are the bottleneck for the whole company.

Every change starts with archaeology

A new rate, a new regulation, a new market — before anyone can change the system, someone must answer “what will this touch?” by reading undocumented source.

Weeks per change, consultants by the million

Change-impact analysis is done by grepping, interviewing retirees, and assembling spreadsheets. A change that should take days takes months.

This is the exact gap the Conduct track names — we take it on end-to-end.

The solution

one agent, five steps, evidence all the way down

1

EXCAVATE

point it at a legacy listing — or paste your own (multi-file, live)

2

DECODE

every business rule extracted with line-level evidence

3

MAP

interactive dependency graph: paragraphs, DB2 tables, files

4

IMPACT

plain-language change -> blast radius + regression contract

5

MODERNIZE

TypeScript + characterization tests, human approves each module

Output: a change dossier — obligation -> evidence -> decision -> artifact — plus GitHub issues and a rollback plan.

Before / after

the 90-second wow

TODAY

- ✗ grep + tribal knowledge + retiree interviews
- ✗ spreadsheets assembled by hand
- ✗ weeks of specialist time — per change
- ✗ no verifiable trail from claim to source line
- ✗ consulting budgets in the millions

WITH STRATA

- ✓ type the business change in plain language
- ✓ blast radius in minutes, every citation machine-verified
- ✓ regression contract: the rules that must NOT change
- ✓ modern TypeScript + characterization tests, human-gated
- ✓ dossier + GitHub issues + rollback plan, one export

weeks → an afternoon, on your own code (live, multi-file)

The user stays in control

control beats autonomy — designed in, not bolted on

Hard review gate

nothing exports and no tool fires until EVERY module carries an explicit human approve / reject decision

Machine-verified evidence

every line citation is checked against the real source (evidenceCheck in every impact response) — claims you can click, not vibes

Dry-run by default

GitHub issue filing shows full payloads in dry-run; live mode is an explicit opt-in with credentials

Visible every step

rule cards jump to exact source lines; the graph shows only edges actually present in the code; rollback plan ships with every dossier

Real engineering, not a prompt wrapper

`works on messy input, recovers from errors`

- **Schema-shaped outputs + repair loop**

every model output is runtime-validated JSON; malformed responses go through a structured repair pass instead of crashing

- **Live on YOUR code**

paste multi-file listings (programs + copybooks + DDL, 4,000-line cap) — the agent runs the full pipeline on unseen input in ~2–4 min

- **Golden tests + CI**

fixture-pinned golden tests run in GitHub Actions on every commit (they have caught real regressions), no LLM key needed

- **One-shot pipeline API**

POST /api/run chains analyze → impact → modernize → dossier; cached showcase answers return in ~1 s

- **Real tool execution**

the agent actually files GitHub issues — see issues #1–#4 on the repo, filed by the agent itself

Architecture

Everything the judges can click is live: the console, the hosted agent, the API, and the issues it filed.

Fetch.ai integration

`conversation-first`: the whole flow works from chat

Hosted on Agentverse

strata-legacy-xray — chat-protocol agent, registered and live (hosted runtime)

Talk to it on ASI:One

send a business change in plain language; the change dossier comes back in seconds for showcase changes, novel ones excavate live

Engineered for hosted limits

cache-first wrapper with async warming; @mention prefixes stripped; meta-questions routed to HELP

agent1qt7djc5s4m59xqzkg7en8v30afdwrejkqxgs2emdcza99y9wug32w7xzvz6

`asil.ai/ai/agent1qt7djc...` · agentverse.ai profile linked in the repo README

Everything is verifiable today

LIVE CONSOLE

strata.axiqo.xyz — paste your own legacy listing, the agent runs on it live

AGENT-FILED ISSUES

github.com/a252937166/strata/issues — #1–#4 filed by the agent (live mode)

CI GREEN

golden tests on every commit — github.com/a252937166/strata/actions

DEMO VIDEO (2:48)

youtu.be/14bQdHeTWjs — paste-your-own-files, blast radius, dossier, ASI:One

HOSTED AGENT

live on Agentverse + ASI:One — conversation in, dossier out

STRATA

Make legacy move — in an afternoon, with the human in charge.
